Scalable GA4 E-commerce Tracking via GTM

Instead of building a separate GA4 tag for every e-commerce event, I set up one dynamic, regex-driven tag that handles the entire funnel — easier to maintain, easier to scale, and fully verified in GA4 DebugView and Realtime reports.

GA4 E-commerce

One Dynamic Tag Instead of Ten

A typical GA4 e-commerce setup needs to track ten or more events — `view_item`, `add_to_cart`, `view_cart`, `begin_checkout`, `add_shipping_info`, `add_payment_info`, `purchase`, and more. The common approach is to build a separate GTM tag and trigger for each one, which quickly becomes repetitive and hard to maintain.

My approach instead uses **one GA4 event tag** with a dynamic `{{Event}}` variable for the event name, paired with a **single Custom Event trigger** using regex matching to catch every e-commerce event in one place. Ecommerce parameters (value, currency, items, tax, shipping tier, transaction ID, payment type) are all pulled dynamically from the `dataLayer`, so the same tag correctly reports the right data no matter which event fired it.

WHY IT MATTERS

Old Approach vs. This Setup

Separate Tag Per Event

- 10+ tags and 10+ triggers to build and maintain
- Every new event means a new tag from scratch
- Higher chance of inconsistent parameter mapping

One Dynamic Tag

- One tag, one trigger, regex-matched event names
- New events added by extending the regex — no new tag needed
- Consistent parameters pulled from the `dataLayer` every time

One Trigger, Every E-commerce Event

GTM TRIGGER

Custom Event Trigger with Regex Matching

A single Custom Event trigger set to fire on all ten e-commerce events — purchase, view_item, view_cart, add_payment_info, add_shipping_info, begin_checkout, view_item_list, add_to_cart, select_item, and remove_from_cart — matched with one regex pattern instead of ten separate triggers.

GTM TAG

Dynamic Event Name & Parameters

The GA4 tag itself uses a dynamic {{Event}} variable for the event name, with value, currency, items, shipping tier, tax, transaction ID, and payment type all mapped from dataLayer variables — so the same tag adapts correctly to whichever event triggered it.

Full Funnel Coverage, Cleanly Organized

GTM CONTAINER

Every Funnel Event Mapped to Its Trigger

The screenshot displays a table within a GTM container, organized into three main columns: 'GA4 Tags', 'Triggers', and 'Timing'. The 'GA4 Tags' column lists various e-commerce events such as 'add_payment_info', 'add_shipping_info', 'add_to_cart', 'begin_checkout', 'purchase', 'select_item', 'view_item', 'view_cart', 'view_item_list', 'remove_from_cart', and 'configuration'. The 'Triggers' column shows corresponding triggers like 'cEvent - add_payment_info', 'cEvent - add_shipping_info', 'cEvent - add_to_cart', 'cEvent - begin_checkout', 'cEvent - purchase', 'cEvent - select_item', 'cEvent - view_item', 'cEvent - view_cart', 'cEvent - view_item_list', 'cEvent - remove_from_cart', and 'All Pages'. The 'Timing' column indicates when each trigger was last used, ranging from '18 minutes ago' to 'an hour ago'. Red boxes and arrows highlight the 'GA4 Tags' and 'Triggers' columns, emphasizing the mapping between them.

GA4 Tags	Triggers	Timing
GA4 - add_payment_info	cEvent - add_payment_info	Unfiled items 18 minutes ago
GA4 - add_shipping_info	cEvent - add_shipping_info	Unfiled items 18 minutes ago
GA4 - add_to_cart	cEvent - add_to_cart	Unfiled items 18 minutes ago
GA4 - begin_checkout	cEvent - begin_checkout	Unfiled items 37 minutes ago
GA4 - purchase	cEvent - purchase	Unfiled items 30 minutes ago
GA4 - select_item	cEvent - select_item	Unfiled items in a few seconds
GA4 - view_item	cEvent - view_item	Unfiled items 42 minutes ago
GA4 - view_cart	cEvent - view_cart	Unfiled items 39 minutes ago
GA4 - view_item_list	cEvent - view_item_list	Unfiled items 24 minutes ago
GA4 - remove_from_cart	cEvent - remove_from_cart	Unfiled items 28 minutes ago
GA4 configuration	All Pages	Unfiled items an hour ago

The complete list of GA4 e-commerce tags alongside their corresponding custom event triggers — from `add_payment_info` through `view_item_list` — showing the full funnel is covered with a clean, consistent naming structure.

GTM TAG SETTINGS

Ecommerce Data Sourced from the DataLayer

The screenshot shows the 'Google Analytics: GA4 Event' tag configuration in GTM. The 'Event Name' field is set to `{{Event}}`. Under the 'More Settings' section, the 'Ecommerce' settings are expanded, showing that 'Send Ecommerce data' is checked and the 'Data source' is set to 'Data Layer'. A red box highlights the 'Ecommerce' settings, and another red box highlights the 'Event Name' field. A 'Save' button is visible in the top right corner.

Field	Value
Measurement ID	{{RM}}
Event Name	{{Event}}
Event Parameters	
User Properties	
More Settings	
Ecommerce	
Send Ecommerce data	☒
Data source	Data Layer
Advanced Settings	

The tag's Ecommerce setting is enabled with the dataLayer as the data source, so item-level details (products, prices, quantities) flow through automatically with every event, no manual duplication required.

Verified Live in GA4

GA4 DEBUGVIEW

Full Purchase Funnel, Confirmed Step by Step

The dynamic tag firing correctly across the entire session — begin_checkout, add_shipping_info, add_payment_info, user_engagement, page_view, and purchase — all captured live in DebugView with accurate event counts.

GA4 REALTIME

Realtime Overview — Full Event Breakdown

The same setup reporting cleanly in GA4's Realtime overview — active users, top events, and key events (purchase) all populating correctly from the single dynamic tag configuration.

LET'S WORK TOGETHER

Want a GA4 setup that scales?

Whether you need a full e-commerce funnel built from scratch or an existing setup cleaned up and consolidated, I'll build it in a way that's easy to maintain and simple to extend as your tracking needs grow.
