Marjana

Custom Event & iFrame Tracking via GTM

Form platforms like JotForm, Typeform, and Calendly load inside iframes, which blocks standard tracking. Here's how I capture those submissions — and every other custom interaction — using pure JavaScript, verified end to end across browser and server.

The Problem with iFrame Forms

Tools like JotForm, Typeform, Paperform, Calendly, and HubSpot embed their forms inside an iframe. Because an iframe is a separate document, GTM can't see form submissions happening inside it with a normal trigger — there's no click or page change on the parent page to listen for.

My approach uses a **Custom HTML tag with plain JavaScript** — no third-party libraries — that listens for message events dispatched by the embedded form when a submission completes. The listener logic is built and tested directly by inspecting these events in the browser console, then the relevant data is caught, pushed into the dataLayer as a custom event, and from there it flows into GTM exactly like any other trigger — firing Meta Pixel, server-side GA4, and server-side Meta CAPI tags together.

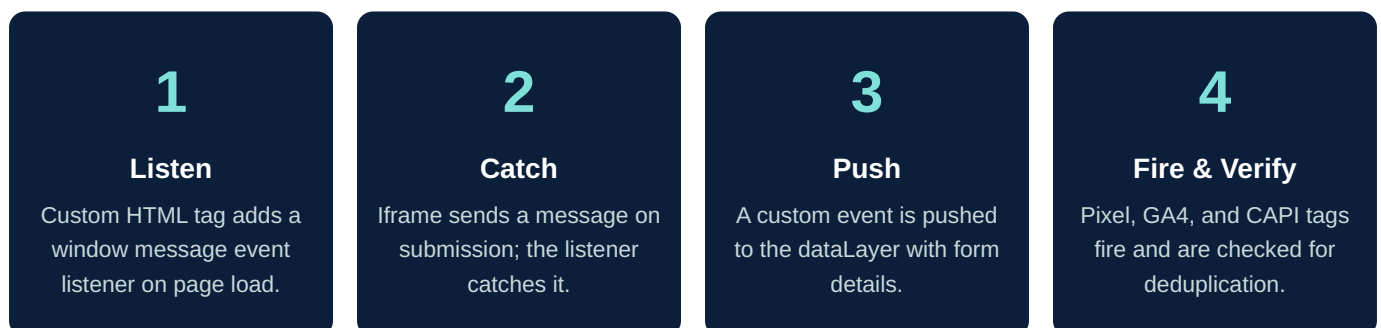

PLATFORMS COVERED

Where This Works

JotForm Form submission tracking	Typeform Form submission tracking	Calendly Booking confirmation tracking
HubSpot Forms Embedded form tracking	YouTube Video engagement tracking	Paperform Form submission tracking

HOW IT WORKS

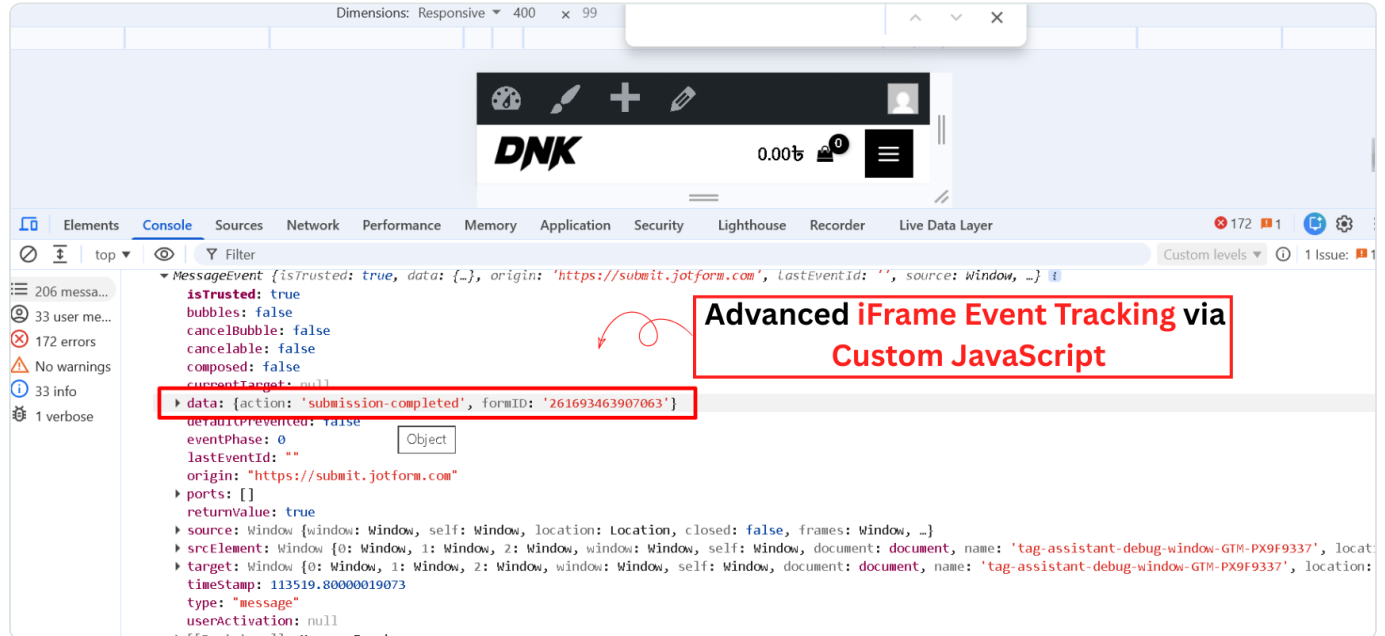

The Process

Capturing the iFrame Message

CUSTOM JAVASCRIPT

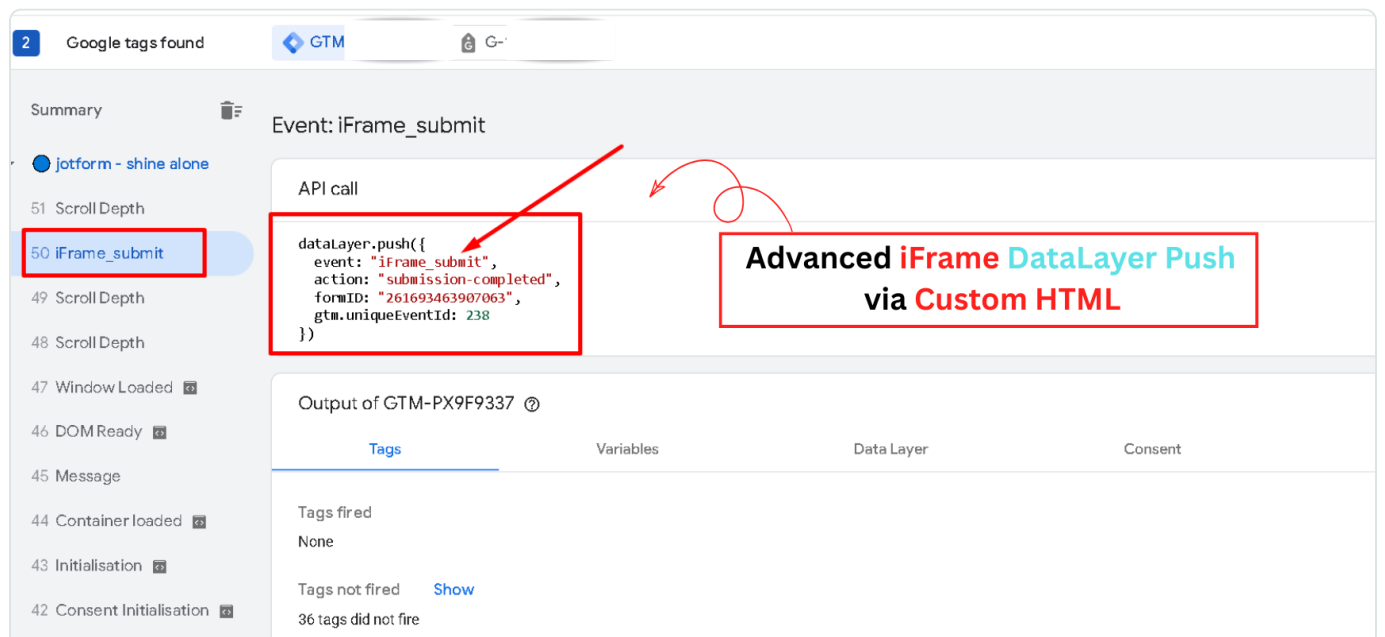

iFrame Message Event Captured in Console

The raw message event sent by JotForm on submission, inspected directly in the browser console — showing the exact data (action, formID) the listener catches and uses to trigger tracking.

GTM CUSTOM HTML

DataLayer Push via Custom HTML Tag

The captured message pushed into the dataLayer as an iFrame_submit event with action, form ID, and a unique GTM event ID — all handled with plain JavaScript, no third-party library required.

The same video event received from both browser and server, correctly deduplicated in GA4's real-time test events log.

Full Coverage, Fully Verified

GTM SERVER CONTAINER

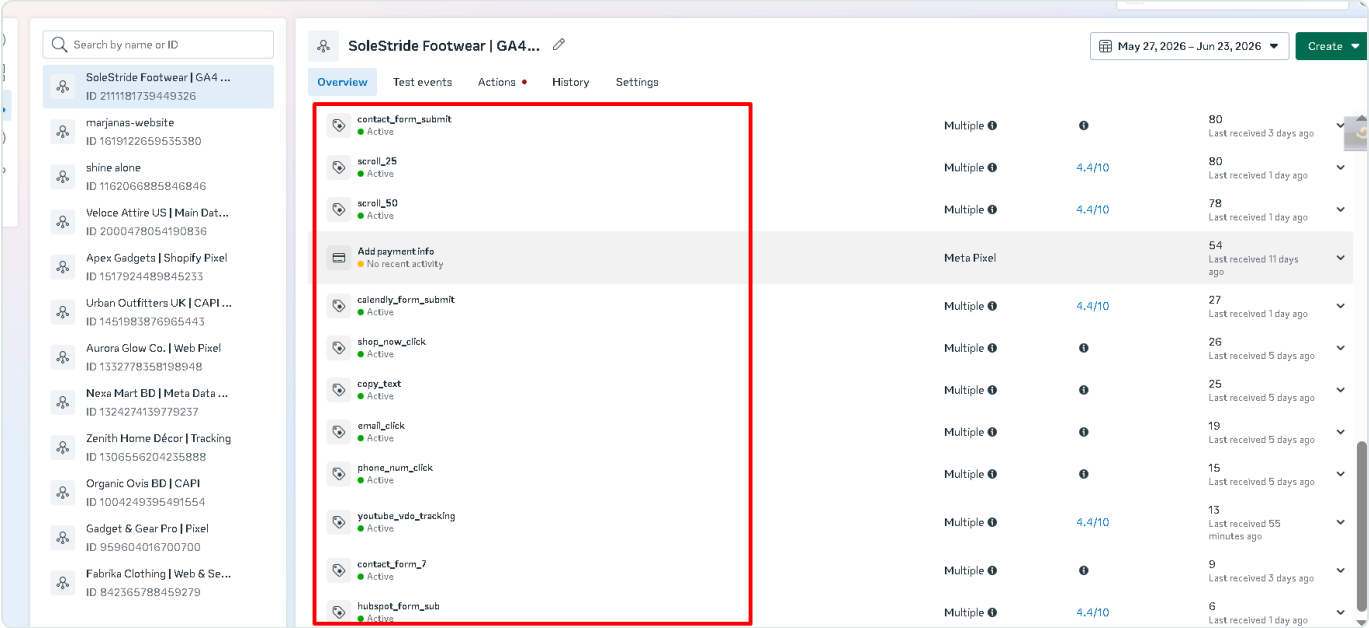

Custom HTML & Server-Side Tag Validation

JotForm and Typeform events validated end to end — Meta Pixel, server-side GA4, and server-side Meta CAPI tags all firing correctly alongside the underlying Custom HTML listener tags.

GA4 OVERVIEW

All Custom Events, Active & Reporting

A wider view of the custom event coverage on this project — Calendly, HubSpot, JotForm, Typeform, YouTube video, contact forms, and click tracking, all active and receiving real data in GA4.

LET'S WORK TOGETHER

Got a form or iframe that won't track?

Embedded forms, booking widgets, video players, or any third-party element that lives inside an iframe — I'll get it tracked properly, with browser and server events that match and deduplicate correctly.
