

WEB ANALYTICS & TRACKING SPECIALIST

Marjana

GTM • Meta Pixel & CAPI • GA4 • Server-Side Tracking

I help e-commerce brands recover lost conversion data and fix broken tracking — with clean, deduplicated, server-side-verified analytics setups you can actually trust.

About Me

I'm Marjana, a web analytics specialist focused on Google Tag Manager, Meta Pixel, Conversions API (CAPI), and GA4. I started in social media management, which gave me a strong sense of how marketing teams actually use data — then moved deeper into the technical side of tracking to close the gap between what ad platforms report and what's really happening on a website.

My work centers on getting tracking *right*: browser and server-side events that match, deduplicate correctly, and hold up when you check them in GA4 DebugView or Meta Events Manager — not just tags that "fire" without verification.

Quick Facts

- Specialized in GTM + Server-Side (sGTM)
- Meta Pixel & CAPI deduplication expert
- GA4 e-commerce funnel setup & verification
- Custom event & iframe form tracking
- WooCommerce & Shopify tracking experience

WHAT I OFFER

Services

01

GTm Setup & Audit

Full container setup, cleanup, and audit for accurate, reliable tracking across your site.

02

Meta Pixel + CAPI

Browser and server-side Meta tracking with proper event deduplication for accurate ad reporting.

03

Server-Side GTM

Server container setup routing GA4 and Meta events through your own domain for better data quality.

04

GA4 E-commerce

Full funnel tracking — view content to purchase — configured and verified in DebugView.

05

Custom Event Tracking

Iframe form submissions (Paperform, JotForm, Typeform), HubSpot forms, and custom triggers.

06

Tracking Troubleshooting

Diagnosing Ads Manager vs Events Manager discrepancies and fixing broken or missing events.

My Process

Every project follows the same disciplined process, so tracking is not just "set up" but verified end to end.

1

Audit

Review existing GTM, Pixel & GA4 setup to find gaps and duplicate events.

2

Setup

Configure browser & server-side tags, triggers, and variables.

3

Deduplicate

Match event IDs across browser and server so platforms count each event once.

4

Verify

Confirm in GTM Preview, GA4 DebugView, and Meta Events Manager before handoff.

PROOF OF WORK

Featured Tracking Setups

The following pages show real, verified tracking configurations from recent practice and client-style implementations — not just theory.

Meta Pixel & CAPI Deduplication

BROWSER + SERVER

PageView Event — Verified Deduplication

The screenshot displays the Meta Pixel interface for the 'SoleStride Footwear | GA4 ...' dataset. The left sidebar lists various datasets, with 'SoleStride Footwear | GA4 ...' highlighted. The main panel shows the 'Test events' tab, where a 'PageView' event is being tracked. A red box highlights the 'Advanced PageView Tracking & Event Deduplication Setup' section. The 'Events Received' table shows a 'PageView' event received from the 'Server' via 'Manual Setup', which is marked as 'Deduplicated'. The event details include the URL, event ID, and action source.

Events Received	Received From	Setup Method	Event ID	Time Received
PageView Custom event Deduplicated	Server	Manual Setup	178102069...	Today at 9:58:13 PM
Purchase Deduplicated	Server	Manual Setup	178102069...	Today at 9:58:13 PM
Purchase Deduplicated	Browser	Partner integration	178102069...	Today at 9:58:12 PM
PageView Custom event Processed	Browser	Partner integration	178102069...	Today at 9:58:12 PM

Server-side PageView events received and matched against the browser event, shown here in the marketing channel's real-time test events log.

BROWSER + SERVER

ViewContent Event — Verified Deduplication

The screenshot displays the Meta Pixel interface for the 'SoleStride Footwear | GA4 ...' dataset. The left sidebar lists various datasets, with 'SoleStride Footwear | GA4 ...' highlighted. The main panel shows the 'Test events' tab, where a 'View content' event is being tracked. A red box highlights the 'Advanced ViewContent Tracking & Event Deduplication Setup (Browser + Server Side)' section. The 'Events Received' table shows a 'View content' event received from the 'Server' via 'Manual Setup', which is marked as 'Deduplicated'. The event details include the URL, event ID, parameters (value, currency, content IDs, content type, content name, contents), and action source.

Events Received	Received From	Setup Method	Event ID	Time Received
View content Processed	Server	Manual Setup	178102922...	Today at 12:20:24 AM
View content Processed	Browser	Partner integration	178102922...	Today at 12:20:24 AM
View content Deduplicated	Browser	Partner integration	178102922...	Today at 12:20:24 AM
View content Deduplicated	Server	Manual Setup	178102922...	Today at 12:20:24 AM

ViewContent tracked with full product parameters (content ID, type, name, price) and deduplicated across browser and server sources.

Meta Pixel & CAPI Deduplication (cont.)

BROWSER + SERVER

AddToCart Event — Verified Deduplication

The screenshot shows the GA4 Test Events interface for the 'SoleStride Footwear | GA4 ...' dataset. The 'Add to cart' event is highlighted, showing it was 'Deduplicated'. The event details panel shows the URL, Event ID, and parameters: value (150), currency (BDT), content_id ('349'), content_type (product), content_name (Dark Brown Jeans), and contents (an array of item objects). The event is attributed to 'Server' and 'Manual Setup'.

Advanced AddToCart Tracking & Event Deduplication Setup (Browser + Server Side)

Browser Pixel and server-side CAPI events for AddToCart are matched using a shared Event ID, so Meta correctly deduplicates and counts the event once — confirmed live in GA4's Test Events view with full event parameters (value, currency, content data).

BROWSER + SERVER

InitiateCheckout Event — Verified Deduplication

The screenshot shows the GA4 Test Events interface for the 'SoleStride Footwear | GA4 ...' dataset. The 'Initiate checkout' event is highlighted, showing it was 'Deduplicated'. The event details panel shows the URL, Event ID, and parameters: value (150), currency (BDT), content_id ('349'), content_type (product), content_name (Dark Brown Jeans), and contents (an array of item objects). The event is attributed to 'Server' and 'Manual Setup'.

Advanced InitiateCheckout Tracking & Event Deduplication Setup (Browser + Server Side)

Same dual-tracking approach applied to InitiateCheckout, with browser and server events reconciled under one Event ID for clean, non-duplicated reporting.

BROWSER + SERVER

Purchase Event — Verified Deduplication

Advanced Purchase Tracking & Event Deduplication Setup (Browser + Server Side)

The final and most critical step — Purchase — matched across browser and server sources using a shared Event ID, confirmed live in GA4's Test Events view with full order details (value, currency, order ID, content data).

Facebook CAPI Purchase Tracking with Dynamic Event ID & User Data

The server-side Meta CAPI tag configuration behind it — dynamic Event ID matching, hashed customer data (email, phone, name, address), and full order parameters (value, currency, items, transaction ID) sent securely from the server.

GA4 Funnel & Server-Side Tag Verification

GA4 DEBUGVIEW

E-commerce Funnel Tracking

GA4 E-commerce Funnel Tracking & DebugView Verification

TOP EVENTS	LAST 30 MINS	17 TOTAL
page_view	6	16
user_engagement	5	1
view_item	2	0
add_to_cart	1	0
begin_checkout	1	0
purchase	1	0
session_start	1	0

Full funnel — page_view, view_item, add_to_cart, begin_checkout, purchase — verified live in GA4 DebugView with correct item-level parameters.

GTM SERVER CONTAINER

Server-Side & GA4 Tags Firing Correctly

Advanced Server-Side & GA4 Tags Fired Verification

Request	Tags	Variables	Event data	Console (0)
Tags fired				
Meta Conversion API Advance				
GA4 Ecommerce Tracking Advance				
Conversions API Tag - Fired 20 times				
Google Analytics: GA4 - Fired 28 times				
Tags not fired				
None				

GTM server container confirming both the Meta Conversions API tag and the GA4 Ecommerce Tracking tag fired successfully, with zero tags failing.

Server-Side Requests & Full Funnel Setup

GTM SERVER CONTAINER

Incoming & Outgoing Request Verification

Server container correctly receiving the incoming hit and forwarding it on to both Google Analytics and Meta's Graph API endpoints with successful response codes.

FULL FUNNEL

Advanced Full Funnel Web Tracking Setup

Complete client-side and server-side funnel — 12+ tags across Meta Pixel and server-side GA4/Meta events, all firing without errors from PageView through Purchase and Add Payment Info.

Full Funnel — Verified End to End

Every stage shown in this portfolio — PageView, ViewContent, AddToCart, InitiateCheckout, and Purchase — is tracked on both the browser and server side, matched by Event ID, and confirmed in Meta Events Manager as "Deduplicated." That's what a fully verified tracking setup looks like: no inflated numbers, no missing conversions.

WHY WORK WITH ME

What You Get

Verified, Not Just Installed

Every event is checked in GTM Preview, GA4 DebugView, and Meta Events Manager before delivery.

Deduplication Done Right

Browser and server-side events matched by Event ID so your ad platforms report accurate numbers.

Clear Communication

You'll get plain explanations of what was set up and why — no unnecessary jargon.

LET'S WORK TOGETHER

Ready to fix your tracking?

Whether it's a broken Meta Pixel, missing GA4 events, or a full server-side migration, I'll set it up, deduplicate it, and prove it works — with screenshots like the ones in this portfolio.
